MICROBIAL GROWTH SCREENING

REPORT #: SB-2026-80871

INCUBATION METHOD AS PERFORMED

CLIENT & SAMPLE INFORMATION

Client	SynovaBiotech	**Report ID**	SB-2026-80871
Product name	Selank	**Strength**	10mg
Lot / batch	SL702	**Condition**	Lyophilized Powder
Report date	9/26/26	**Access key**	SBSL201

TEST METHODOLOGY

Test performed	14 Day Microbial Growth Screening	**Culture system**	Aerobic and anaerobic bottles
Incubation period	14 days	**Detection principle**	Colorimetric CO_2 detection
Sample requirement	1 vial (destructive)	**Condition as received**	Sealed

TEST RESULTS

Parameter	Result / observation
Aerobic microbial growth	No microbial growth detected
Anaerobic microbial growth	No growth detected
Final determination	No microbial growth detected during 14 day incubation period

METHOD OVERVIEW

The submitted sample was aseptically introduced into BacT ALERT culture bottles designed to support microbial growth detection. The BacT ALERT system continuously monitors each bottle during incubation. If microorganisms are present and grow, they may produce carbon dioxide which interacts with the colorimetric sensor in the bottle; the instrument detects this change photometrically. If growth is detected, the system automatically flags the bottle as positive and records the time to detection. If no growth is detected during the full incubation period, the final result is reported as no microbial growth detected.

INTERPRETATION

No microbial growth was detected in the submitted sample during the 14 day BacT ALERT incubation period. The result indicates that no detectable microbial growth was observed under the conditions of this screening method. The result should not be interpreted as a guarantee of sterility for the entire batch lot or product line.
